# WHY DO PEOPLE READ INFORMATION?

INFORMATION ISN'T IGNORED BECAUSE IT'S UNAVAILABLE

## CONTEXT

Tourist spaces are highly stimulated environments filled with crowds, driven by movements, and consumed by spectacles. We scan everything, choose to pay attention to certain things, and retain even less. In such a fast-paced environment, the attention flies, making the information consumption least important when competed against everything else.

## OBJECTIVE

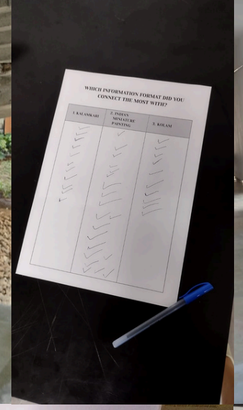

The objective of the simulation was to refocus attention, create curiosity to drive consumption, and hold interest long enough for them to want to retain it.

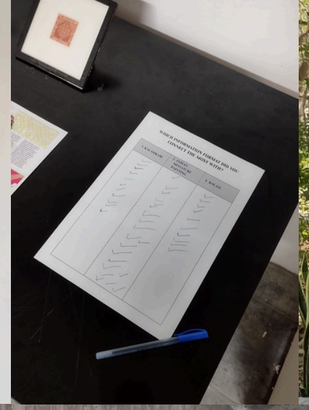

## SIMULATIONS SETUP

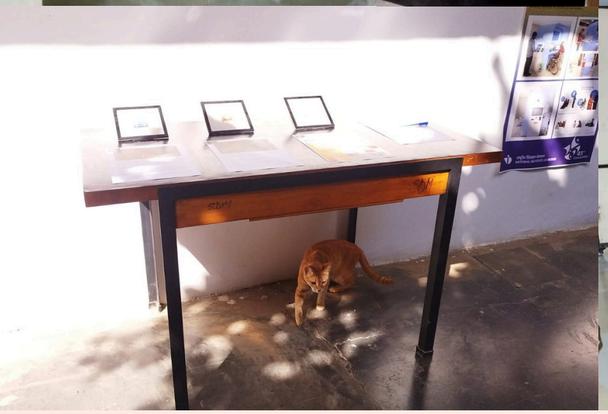

Three sets of simulations planned to be carried out to understand the behaviour better and design the system efficiently. First simulation focused on visual data intervention, Second simulation focused on curiosity driven visual based storytelling, and the third simulation focused on auditory storytelling.

## DESIGN IMPLICATIONS

Position
Hierarchy
Layering
Multi-sensory
Curiosity
Social behaviour
Spatial embedding

## SIMULATION 1
### VISUAL DATA INTERVENTION

In the first simulation, visual graphics were introduced to present information in a more noticeable and structured format. The intention was to test whether increasing visual prominence of information could attract visitor attention.
While the graphics improved visibility, the intervention showed limited influence on sustained engagement.

## SETUP

Three different sets of information/ graphical representation were placed side by side along with 3 similar kind of artefacts with a feedback form asking about the format preferences of information represented. All three were related to the artefact present there, just the format of information was different, one was in simple paragraph with few worlds in bold, 2nd was in pointers and crisp information represented and the 3rd was highly graphical with information in smaller chunks.

## BEHAVIOUR PATTERN
### (KEY LEARNINGS)

Tested visual hierarchy & positioning
Improved visibility
Limited engagement depth

## SIMULATION 2
### CURIOSITY-BASED STORYTELLING

The second simulation explored whether curiosity-driven prompts could encourage visitors to interact with information. Short narrative facts about trees were attached to selected trees using red ribbons and simple visual markers.
The visual markers acted as curiosity triggers, prompting visitors to approach the trees and read the stories. This simulation demonstrated increased interaction and discussion among visitors.

## SETUP

Fifty information graphics were designed in short storytelling based concept which included fun facts about trees, scientific information, a small introduction of the tree with their decided names according their region or the culture they are associated with.These information cards were tied to approximately fifty trees with red ribbon and few even contained bow. The intervention focused on triggering curiosity through minimal visual cues rather than direct instruction. The format of information was short content with visual hierarchy allowing quick consumption.

## BEHAVIOUR PATTERN
### (KEY LEARNINGS)

Introduced curiosity triggers
Increased pause & interaction
Engagement improved

## SIMULATION 3
### AUDITORY STORYTELLING

The third simulation tested auditory storytelling as a communication stimulus. Short pre-recorded audio clips containing dinosaur facts and narrative elements were played during a guided walk through the dinosaur section. The audio included storytelling elements and sound effects, such as dinosaur roars, to create a more immersive experience.
This approach aimed to examine whether auditory narration could capture visitor attention more effectively than static text-based information.

## SETUP

Initially ten  dinosaur information in storytelling style were recorded in 2 different languages, English and Gujarati  to cater to the local audience of that place. The audio included narrative descriptions along with sound effects such as dinosaur roars, synchronized with specific exhibits. The idea behind audio storytelling was to make the information intriguing , consumable and low effort for the visitors. Later to observe the behaviour closely we choose specific areas where audios would play on loop and visitors can engage without the assistance or supervisio.

## BEHAVIOUR PATTERN
### (KEY LEARNINGS)

Multi-sensory interaction
Strongest behavioural response
Highest engagement observed
